Results

Data Processing and Exclusions

Exclusion criteria applied as stated in the [preregistration](#):

We will exclude participants who did not complete the study, failed an attention check question, failed to pass the Captcha test (i.e., their Captcha score is equal to or lower than 0.5), or are not permanent residents of the geopolitical region where data collection is taking place.

Table 1: Each line indicates how many participants failed each criterion (applied sequentially).

Exclusion Criterion	Number Excluded	Fraction Excluded	Percentage Excluded
Finished == 1	6528	0.2710176	27.101756
Q_RecaptchaScore >= 0.5	937	0.0389007	3.890065
attention check == 0	551	0.0228754	2.287541
Country_Res_YN == Yes	789	0.0327563	3.275626
Total	8016	0.3327936	33.279362

Table 2: Demographic Information of Participants

Demographic	Value
Average age (Std.)	26.27 (10.79)
Age Range	18 to 99
N. males	4685
N. female	10209
N. non binary	141
N. prefer not to respond	152
N. prefer to self-describe	58

Table 3: Demographic Information of Participants by Cultural Classification

Demographic	Individualistic	Collectivistic
N participants	10525	4720
Average age (SD)	26.91 (11.48)	24.86 (8.89)
Age range	18 to 99	18 to 97
N males	3101	1584
N females	7181	3028
N non-binary	119	22
N prefer not to respond	89	63
N prefer to self-describe	35	23

Table 4: Level of education by cultural group.

Education level	Collectivistic, N (%)	Individualistic, N (%)
Less than a high school or secondary school degree (or equivalent)	34 (0.7%)	119 (1.1%)
High school or secondary school degree (or equivalent)	2,207 (46.8%)	6,447 (61.3%)
Bachelor's degree (or equivalent)	1,833 (38.8%)	2,531 (24.0%)
Postgraduate degree (MA, PhD, JD, etc.)	552 (11.7%)	1,330 (12.6%)
Prefer not to respond	94 (2.0%)	98 (0.9%)

Use of external resources

Table 5: Percentage and number of responses reporting use of external resources, split by problem and condition.

problem	Baseline	Feedback	Justification	Feedback + justification
Problem 1	6.64% (N = 258)	6.82% (N = 265)	7.70% (N = 286)	7.07% (N = 266)
Problem 2	6.95% (N = 270)	6.41% (N = 249)	8.24% (N = 306)	6.73% (N = 253)
Problem 3	10.24% (N = 398)	9.60% (N = 373)	11.69% (N = 434)	11.30% (N = 425)
Problem 4	8.98% (N = 349)	8.70% (N = 338)	11.23% (N = 417)	10.37% (N = 390)
Problem 5	9.57% (N = 372)	9.91% (N = 385)	11.40% (N = 423)	11.75% (N = 442)
Problem 6	10.86% (N = 422)	9.27% (N = 360)	12.93% (N = 480)	12.58% (N = 473)

Familiarity

Table 6: Percentage and number of participants reporting familiarity, split by problem and condition.

problem	Baseline	Feedback	Justification	Feedback + justification
Problem 1	50.19% (N = 1951)	52.72% (N = 2048)	52.24% (N = 1939)	55.04% (N = 2070)
Problem 2	45.02% (N = 1750)	46.51% (N = 1807)	45.37% (N = 1684)	46.82% (N = 1761)
Problem 3	16.03% (N = 623)	14.47% (N = 562)	16.92% (N = 628)	16.35% (N = 615)
Problem 4	31.31% (N = 1217)	31.02% (N = 1205)	31.84% (N = 1182)	31.67% (N = 1191)
Problem 5	26.19% (N = 1018)	25.41% (N = 987)	27.45% (N = 1019)	27.12% (N = 1020)
Problem 6	23.10% (N = 898)	24.20% (N = 940)	24.52% (N = 910)	24.75% (N = 931)

Language background of participants

Response	N	%
Fluency among non-native speakers		
Prefer not to respond	21	1.0
Beginner	44	2.1
Intermediate	397	19.2
Advanced	911	44.2
Expert/Proficient	690	33.4
Native speaker of the study language		
Yes	12888	85.5
No	2064	13.7
Prefer not to respond	120	0.8

Fluency was assessed only among participants who reported that the study language was not their native language.

Language background

Confirmatory Analyses

Table 7: Mean accuracy by CRT problem and phase (here 'intuitive' is phase 1 and 'reflective' is phase 2). Computed after applying exclusion criteria based on on familiarity and use of external resource.

	justification	feedback	problem	intuitive	reflective
J		F	1	0.20	0.75
J		F	2	0.43	0.85
J		F	3	0.10	0.53
J		F	4	0.23	0.76
J		F	5	0.08	0.47
J		F	6	0.22	0.62
J		NF	1	0.19	0.49
J		NF	2	0.42	0.74
J		NF	3	0.10	0.49
J		NF	4	0.25	0.57
J		NF	5	0.09	0.35
J		NF	6	0.22	0.48
NJ		F	1	0.21	0.75
NJ		F	2	0.40	0.81
NJ		F	3	0.11	0.38
NJ		F	4	0.27	0.71
NJ		F	5	0.09	0.35
NJ		F	6	0.24	0.54
NJ		NF	1	0.18	0.44
NJ		NF	2	0.41	0.67
NJ		NF	3	0.11	0.33
NJ		NF	4	0.25	0.50
NJ		NF	5	0.10	0.29
NJ		NF	6	0.23	0.39

Figure 1: Probability that a correct decision is made in phase 2 rather than in phase 1 (H1 variable), split by country and culture. Error bars are standard errors between participants in each country.

Models for H1a and H1b(Correction during deliberation)

Table 8: Model for H2a and H3a.

Predictor	Estimate	SE	95% CI	p-value
(Intercept)	0.146	0.071	[0.007, 0.285]	.039

Confirmatory hypothesis testing summary

Table 14: Summary of preregistered hypothesis tests after including by-problem random intercepts

Hypothesis	Prediction	Supported	p-value(s)
H1a	Less than half of correct answers will arise from error correction during deliberation	No	.981
H1b	Baseline performance is below 50% in both cultural groups	No	Individualistic = 1.000; Collectivistic = .115
H2a	Feedback increases correction overall	Yes	< .001
H2b	Feedback increases correction in both cultural groups	Yes	Individualistic = < .001; Collectivistic = < .001
H3a	Justification increases correction overall	Yes	< .001
H3b	Justification increases correction in both cultural groups	Yes	Individualistic = < .001; Collectivistic = < .001

Robustness Checks

Random Effects for CRT Problem

Table 15: Model for H2a and H3a (model with random intercepts for CRT problem).

Table 28: Summary of preregistered hypothesis tests after including by-problem random intercepts

Hypothesis	Prediction	Supported	p-value(s)
H1a	Less than half of correct answers will arise from error correction during deliberation	No	.993
H1b	Baseline performance is below 50% in both cultural groups	No	Individualistic = 1.000; Collectivistic = .135
H2a	Feedback increases correction overall	Yes	< .001
H2b	Feedback increases correction in both cultural groups	Yes	Individualistic = < .001; Collectivistic = < .001
H3a	Justification increases correction overall	Yes	< .001
H3b	Justification increases correction in both cultural groups	Yes	Individualistic = < .001; Collectivistic = < .001

Exploratory Analyses

Scales reliability and measurement invariance

Note: for these analyses I have included only countries with $N \geq 100$.

Intellectual humility

Table 29: Internal consistency of the Intellectual Humility scale by country (only countries with $N > 100$ shown).

Country	N	alpha
United States	1672	0.64
Turkey	1468	0.65
Spain	1446	0.64
Italy	896	0.57
United Kingdom	842	0.67
Poland	452	0.62
Philippines	414	0.68

Table 30: Measurement invariance analysis for the Intellectual Humility scale

Model	CFI	TLI	RMSEA	SRMR	Δ CFI	Δ RMSEA
Configural	0.973	0.943	0.050	0.029	NA	NA
Metric	0.956	0.930	0.056	0.046	-0.017	0.005
Scalar	0.924	0.905	0.065	0.062	-0.032	0.009

As an exploratory test of cross-country measurement invariance, we fitted multi-group CFAs in which the nine items loaded on a substantive intellectual-humility (IH) factor while separate positive- and negative-wording method factors captured the method effects identified in the original scale validation. The IH factor was specified as independent of the wording factors, while the two method factors were allowed to covary. The configural model showed good fit (CFI = .973, RMSEA = .050, SRMR = .029). We then constrained only the substantive IH loadings to equality across countries, leaving wording-factor loadings free; this produced a modest deterioration in fit (Δ CFI = -.017, Δ RMSEA = .005, Δ SRMR = .017). Adding equality constraints on item intercepts produced a larger deterioration (Δ CFI = -.032, Δ RMSEA = .009, Δ SRMR = .016). Thus, using the conventional Δ CFI $\leq$.01 criterion, strict metric and scalar invariance were not supported, although departures from metric invariance were relatively modest. These results suggest that the scale captures a broadly similar construct across countries, but some caution is warranted.

Individual Differences and Corrective Behaviour

Table 31: Correlations between individual-difference measures

	IH_score	AOT_score	IC_HI	IC_VI	IC_HC	IC_VC

Confidence Calibration and Intellectual Humility

Figure 2: Number of correct answer (vertical coordinates) plotted as a function of the answer to the calibration responses (e.g. the participant's estimates of their own accuracy; horizontal coordinates). Some jitter added for visibility. Both plots demonstrates substantial overconfidence, since in both cases most points lie below the identity line. For this plot we only excluded problems where participants declared using external resources.

Table 36: Generalised additive models predicting participants' estimates of performance.

Model	Component	Term	Estimate	SE	edf	Ref. df	Statistic	p
Intuitive	Parametric	Intercept	3.725	0.011			349.164	<.001
Intuitive	Smooth	Actual accuracy			4.121	4.813	151.728	<.001
Intuitive	Smooth	Intellectual humility			2.279	2.757	10.036	<.001
Intuitive	Smooth	Actual accuracy × intellectual humility			1.894	2.388	0.866	.510
Reflective	Parametric	Intercept	4.975	0.009			583.248	<.001
Reflective	Smooth	Actual accuracy			4.804	5.518	298.650	<.001
Reflective	Smooth	Intellectual humility			1.997	2.456	1.202	.281
Reflective	Smooth	Actual accuracy × intellectual humility			1.622	2.019	4.232	.014

Figure 3: Intellectual humility and calibration of estimated performance. Generalised additive models (GAMs) predicting participants' estimated number of correct answers from their actual accuracy and intellectual humility, fitted separately for the intuitive (left) and reflective (right) phases. Lines show model-predicted estimates for intellectual humility at the mean and ± 1 SD; shaded bands indicate 95% confidence intervals. The dashed diagonal indicates perfect calibration, such that values above the line reflect overestimation and values below the line reflect underestimation. Intellectual humility was associated with a small overall shift in estimates in the intuitive phase, whereas in the reflective phase it showed a small but significant interaction with actual accuracy.

Figure 4: Intellectual humility, actual accuracy, and estimated performance. Generalised additive models (GAMs) predicting participants' estimated number of correct answers from actual accuracy and intellectual humility, fitted separately for the intuitive (left) and reflective (right) phases. Lines show model-predicted estimates across the observed range of intellectual humility scores, plotted separately for each level of actual accuracy; shaded bands indicate 95% confidence intervals. In the intuitive phase, intellectual humility was associated with a small overall downward shift in estimated performance across accuracy levels. In the reflective phase, the association between intellectual humility and estimated performance varied modestly as a function of actual accuracy, consistent with a small but significant interaction.

Robustness analysis: quasibinomial GAMs

As a robustness analysis, we repeated the calibration analyses using quasibinomial GAMs. These models constrain predicted estimates to the possible 0–6 range while allowing for overdispersion relative to the binomial variance.

Model estimates

Table 37: Quasibinomial generalised additive models predicting participants' estimates of performance.

Model	Component	Term	Estimate	SE	edf	Ref. df	Statistic	p
Intuitive	Parametric	Intercept	0.502	0.008			65.621	< .001
Intuitive	Smooth	Actual accuracy			4.420	5.032	135.304	< .001
Intuitive	Smooth	Intellectual humility			2.187	2.661	10.229	< .001
Intuitive	Smooth	Actual accuracy × intellectual humility			1.610	2.009	0.582	.570
Reflective	Parametric	Intercept	1.662	0.011			150.685	< .001
Reflective	Smooth	Actual accuracy			5.151	5.754	257.390	< .001
Reflective	Smooth	Intellectual humility			2.011	2.473	2.162	.093
Reflective	Smooth	Actual accuracy × intellectual humility			2.341	2.936	5.344	.002

Predicted calibration curves

Intellectual humility interaction plots

Figure 5: Quasibinomial robustness analysis of intellectual humility and calibration of estimated performance. Lines show model-predicted estimates at the mean and ± 1 SD of intellectual humility; shaded bands indicate 95% confidence intervals. The dashed diagonal indicates perfect calibration.

Figure 6: Quasibinomial robustness analysis of intellectual humility, actual accuracy, and estimated performance. Lines show model-predicted estimates across the observed range of intellectual humility scores, separately for each level of actual accuracy; shaded bands indicate 95% confidence intervals.
